Hamiltonian Group Actions

Group Actions

- *G* compact connect Lie group, $Lie(G) = \mathfrak{g}$.
- ► $G \subset X$ gives rise to an infinitesimal action of \mathfrak{g} which associates to each $\xi \in \mathfrak{g}$ a vector field $\xi^{\#}$.

Hamiltonian Functions

- (X, ω) symplectic manifold, and $G \subset X$ preserves ω .
- ▶ Say that *G* acts in a **Hamiltonian way** on *X* if every $\xi \in \mathfrak{g}$ has a function $\phi^{\xi} \in C^{\infty}(X)$ such that

$$\imath_{\xi^{\#}}\omega = d\phi^{\xi}.$$

Moment Maps

Definition

Dual notion is the **moment mapping** $\mu: X \to \mathfrak{g}^*$, defined by

$$(\mu(\mathbf{p}), \ \xi) = \phi^{\xi}(\mathbf{p}),$$

for all $p \in X$ and $\xi \in \mathfrak{g}$.

Properties

- μ is G-equivariant when $G \subset \mathfrak{g}^*$ by the dual coadjoint action.
- If G is abelian (*i.e.* a torus), μ is unique up to a constant since dual coadjoint action is trivial.

2. Toric Manifolds

More on Hamiltonian *G*-Spaces

Transitive Actions

▶ Recall: action is **transitive** if for any pair $x, y \in X$, there exists an element $g \in G$ such that $g \cdot x = y$.

Theorem (Kostant) [Gui94]: For compact *G*, all Hamiltonian *G*-spaces with transitive *G*-action are coadjoint orbits.

For G abelian \implies no positive dimensional Hamiltonian G-spaces with transitive action.

Effective Actions

Theorem [Gui94]: If *G* acts effectively, then $\dim X \ge 2 \dim G$.

So for G abelian and acting effectively, simplest examples are when dim X = 2 dim G.

Symplectic Toric Manifolds

Definition

Definition: A **symplectic toric manifold** is a compact connected symplectic manifold (X^{2n}, ω) with an effective Hamiltonian action of a torus T^n , with moment map $\mu: X \to \mathbb{R}^n$.

Example

 $T^n \subset \mathbb{C}^n$ diagonally, with moment map

$$\mu: \mathbb{C}^n \to \mathbb{R}^n, \quad \mu(z) = \frac{1}{2} \sum_{k=1}^n |z_k|^2 e_k.$$

Symplectic Reduction

Set-Up

- (X, ω) Hamiltonian *G*-space with moment map $\mu: X \to \mathbb{R}^n$.
- $X_0 := \mu^{-1}(0)$, for $c \in \mathbb{R}^n$; X_0 is G-invariant as μ is G-equivariant.

Theorem: If $G \subset X_0$ freely, 0 regular value of μ , then $X_0 \subseteq X$ closed submanifold and dim $X_0 = \dim X - \dim G$.

Marsden-Weinstein Reduction

Theorem: If $G \subset X_0$ freely, $X /\!\!/ G := X_0 / G$ is a symplectic manifold of dimension dim X - 2 dim G.

Symplectic Reduction

Example

- Let $S^1 \subset \mathbb{C}^{n+1}$ as $t \cdot z_k = tz_k$, $k = 1, \dots n+1$.
- Choose the moment map $\mu: \mathbb{C}^{n+1} \to \mathbb{R}$ to be

$$\mu(z) = \sum_{k=1}^{n+1} |z_k|^2 - c^2, \qquad c \in \mathbb{R}.$$

• Then $X_0 = \mu^{-1}(0) = {\|\mathbf{z}\| = c^2} \cong S^{2n+1}$, so

$$\mathbb{C}^{n+1} /\!\!/ S^1 := \mu^{-1}(0)/S^1 \cong S^{2n+1}/S^1 \cong \mathbb{CP}^n,$$

with residual $T^{n+1}/S^1 \cong T^n$ -action.

Residual Torus Action

Example Continued

Residual torus $T^n \subset \mathbb{CP}^n$ diagonally, now with moment map

$$\bar{\mu}(\mathbf{z}) = \frac{1}{2} \left(\frac{|\mathbf{z}_1|^2}{\|\mathbf{z}\|^2}, \dots, \frac{|\mathbf{z}_n|^2}{\|\mathbf{z}\|^2} \right) \in \mathbb{R}^n.$$

- ► Fixed-points for this action are the points with only one non-zero entry, *e.g.* [1 : 0 : . . . , 0].
- Image of $\bar{\mu}$ is the convex hull of the images of the fixed-points.
- ► This is a result of the *Atiyah-Huillemin-Sternberg* convexity theorem.

Convexity

Example

Delzant Polytopes

Definition

A **Delzant polytope** $\Delta \subset \mathbb{R}^n$ is a convex polytope such that [Del88]:

- ▶ (simple): *n* edges meet at each vertex;
- (rational): edges meeting a vertex p are of the form $p + tu_i$, $t \ge 0$ and $u_i \in \mathbb{Z}^n$;
- (smooth): for each p, the u_i form a \mathbb{Z} -basis of \mathbb{Z}^n .

Examples

Delzant's Theorem

Delzant's Theorem [Del88]

Toric manifolds are classified by Delzant polytopes, *i.e.* there is a one-to-one correspondence:

$$\frac{\text{toric manifolds}}{\textit{T}^n-\text{equiv. symplectomorphisms}} \longleftrightarrow \frac{\text{Delzant polytopes}}{\text{SL}(\textit{n};\mathbb{Z})}$$

Examples

Part of the Delzant Construction

Set-Up

• Start with a Delzant polytope, $\Delta = \bigcap_{k=1}^n H_k \subseteq \mathbb{R}^d$, where

$$H_k = \{ x \in \mathbb{R}^d : \langle x, u_k \rangle \geqslant \lambda_k \}, \quad \lambda_k \in \mathbb{R}$$

are inward-pointing half-spaces delimiting Δ .

- ▶ Define a surjective map $\pi : \mathbb{R}^n \to \mathbb{R}^d$, $\pi(e_k) = u_k$, where the e_k are basis vectors for \mathbb{R}^n .
- ▶ Define $\mathfrak{n} := \ker \pi$, and consider the inclusion $\iota : \mathfrak{n} \hookrightarrow \mathbb{R}^n$.

Short Exact Sequence

$$\{0\} \longrightarrow \mathfrak{n} \stackrel{\imath}{\longrightarrow} \mathbb{R}^n \stackrel{\pi}{\longrightarrow} \mathbb{R}^d \longrightarrow \{0\}$$

Part of the Delzant Construction

More Short Exact Sequences

$$\{0\} \longrightarrow \mathfrak{n} \stackrel{\imath}{\longrightarrow} \mathbb{R}^n \stackrel{\pi}{\longrightarrow} \mathbb{R}^d \longrightarrow \{0\}$$

Can exponentiate to get our tori:

$$\{1\} \longrightarrow \mathcal{N} \stackrel{\imath}{\longrightarrow} \mathcal{T}^n \stackrel{\pi}{\longrightarrow} \mathcal{T}^d \longrightarrow \{1\}.$$

Or dualise:

$$\{0\} \longleftarrow \mathfrak{n}^* \leftarrow^{\imath^*} (\mathbb{R}^n)^* \leftarrow^{\pi^*} (\mathbb{R}^d)^* \leftarrow \{0\}.$$

Delzant Construction

Subtorus Action

- ▶ If $T^n \subset \mathbb{C}^n$ diagonally, then $N \leq T^n$ also acts on \mathbb{C}^n via the inclusion, i.
- Moment map for this action via inclusion is

$$\mu: \mathbb{C}^n \xrightarrow{J} (\mathbb{R}^n)^* \xrightarrow{\imath^*} \mathfrak{n}^*,$$

with $J: \mathbb{C}^n \to (\mathbb{R}^n)^*$ the usual moment map,

$$J(z) = \frac{1}{2} \sum_{k=1}^{n} |z_k|^2 e_k + (\lambda_1, \ldots, \lambda_n).$$

End of the Delzant Construction

Symplectic Reduction

Finally for the Delzant $\Delta \subset \mathbb{R}^n$,

$$X_{\Delta} := \mathbb{C}^n /\!\!/ N := \mu^{-1}(0)/N$$

is the corresponding toric manifold, with residual $T^n/N \cong T^d$ -action.

Comments

- $\dim X_{\Delta} = 2n 2\dim N = 2(\dim T^n \dim N) = 2\dim T^d.$
- ▶ The λ 's determine the position of the half-spaces translating λ by an element of ker $i^* \subseteq (\mathbb{R}^n)^*$ gives the same result.
- ► The *u*'s determine their (inwards-pointing) directions.

Review

Old Example

• $T^3 \subset \mathbb{C}^3$ and $S^1 \hookrightarrow T^3$ diagonally:

$$\{1\} \longrightarrow S^1 \stackrel{\imath}{\longrightarrow} T^3 \stackrel{\pi}{\longrightarrow} T^2 \longrightarrow \{1\}.$$

- $u_1 = (1,0), u_2 = (0,1), u_3 = (-1,-1), \text{ so ker } \pi = (t,t,t).$
- ► Thus $i(t) = (t, t, t) \implies i^*(x, y, z) = x + y + z$.
- Moment map

$$\mathbf{z} \stackrel{J}{\longmapsto} \frac{1}{2}(|z_1|^2,|z_2|^2,|z_3|^2) + \lambda \stackrel{\imath^*}{\longmapsto} \frac{1}{2}\|\mathbf{z}\|^2 + \lambda_1 + \lambda_2 + \lambda_3.$$

► Then $X_{\Delta} \cong \mathbb{CP}^2$ with T^2 -action, and moment map image $\mu(X_{\Delta}) = \{\langle x, u_i \rangle \geqslant \lambda_i \}.$

Example

\mathbb{CP}^2 Example

Hyperkähler Manifolds

Definition and Properties

- A hyperkähler manifold is a Riemannian manifold (M, g) with three orthogonal, parallel complex structures J_1, J_2, J_3 , that satisfy the quaternionic relations.
- Get three symplectic forms $\omega_1, \omega_2, \omega_3$, so each (g, J_i, ω_i) give a Kähler structure on M.
- Fixing J_1 , we can write

$$\omega_{\mathbb{R}} := \omega_1, \qquad \omega_{\mathbb{C}} := \omega_2 + \mathbf{i} \cdot \omega_3.$$

Examples

- Quaternionic space \mathbb{H}^n .
- Fixeds I_1 , $T^*\mathbb{C}^n$ inherits a hyperkähler structure.

Hyperhamiltonian Actions

Induced Action

- ▶ For $M = T^*\mathbb{C}^n$, Hamiltonian G-action of \mathbb{C}^n extends to hyperhamiltonian action on $T^*\mathbb{C}^n$.
- ▶ Original $\mu : \mathbb{C}^n \to \mathfrak{g}^*$, induced maps are

$$\mu_{\mathbb{R}}(\mathbf{z}, \mathbf{w}) = \mu(\mathbf{z}) - \mu(\mathbf{w}), \qquad \mu_{\mathbb{C}}(\mathbf{z}, \mathbf{w})(\mathbf{v}) = \mathbf{w}(\hat{\mathbf{v}}_{\mathbf{z}}),$$

for $w \in T_z^* \mathbb{C}^n$, $v \in \mathfrak{g}_{\mathbb{C}}$, and $\hat{v}_z \in T_z \mathbb{C}^n$ induced by v.

Subtori Action

- ▶ If $N \stackrel{\imath}{\hookrightarrow} T^n$, get $N \stackrel{\frown}{\subset} T^*\mathbb{C}^n$ via inclusion as before.
- Maps $\mu_{\mathbb{R}}, \mu_{\mathbb{C}} \to \mathfrak{n}^*, \mathfrak{n}_{\mathbb{C}}^*$ then are:

$$\mu_{\mathbb{R}} = i^* \circ J_{\mathbb{R}}, \qquad \mu_{\mathbb{C}} = i_{\mathbb{C}}^* \circ J_{\mathbb{C}}.$$

Examples

Diagonal Torus Action

For $T^n \subset \mathbb{C}^n \leadsto T^n \subset T^*\mathbb{C}^n$ as $\tau \cdot (z, w) = (\tau z, \tau^{-1} w)$, thus

$$J_{\mathbb{R}}(z, w) = \sum_{k=1}^{n} (|z_k|^2 - |w_k|^2) e_k, \quad J_{\mathbb{C}}(z, w) = \sum_{k=1}^{n} (z_k w_k) e_k.$$

$S^1 \hookrightarrow T^3 \subset T^*\mathbb{C}^n$

Example from before, with $S^1 \stackrel{\imath}{\hookrightarrow} T^3$ diagonally.

$$\mu_{\mathbb{R}}(z, w) = \sum_{k=1}^{3} (|z_k|^2 - |w_k|^2), \quad \mu_{\mathbb{C}}(z, w) = \sum_{k=1}^{3} (z_k w_k).$$

Hyperkähler Reduction

Hyperkähler Quotients [BD00]

- Nice hyperkähler quotient if G acts freely on $(\mu_{\mathbb{R}} \oplus \mu_{\mathbb{C}})^{-1}(\xi)$, for $\xi \in \mathfrak{g}^* \oplus \mathfrak{g}_{\mathbb{C}}^*$ regular.
- Can assume that the $\mathfrak{g}_{\mathbb{C}}^*$ -component of ξ is zero, [BD00].

Recall: $\{1\} \longrightarrow N \stackrel{\imath}{\longrightarrow} T^n \stackrel{\pi}{\longrightarrow} T^d \longrightarrow \{1\}.$

Hyperkähler Analogues [Pro04]

For a toric $X = \mathbb{C}^n /\!\!/ N = \mu^{-1}(\lambda)/N$, its **hyperkähler** analogue is

$$M := T^*\mathbb{C}^n /\!\!/\!/ N := (\mu_{\mathbb{R}}^{-1}(\lambda) \cap \mu_{\mathbb{C}}^{-1}(0))/N,$$

and is a hypertoric variety.

Residual T^d -Action

• Residual $T^d = T^n/N$ acts on M, with moment maps

$$\bar{\mu}_{\mathbb{R}}[z, w] = \frac{1}{2} \sum_{k=1}^{n} (|z_k|^2 - |w_k|^2 - \lambda_k) \partial_k \in \ker(i^*) \subseteq \mathbb{R}^d,$$

$$\bar{\mu}_{\mathbb{C}}[z, w] = \sum_{k=1}^{n} (z_k w_k) \partial_k \in \ker(i^*_{\mathbb{C}}) \subseteq \mathbb{C}^d.$$

▶ Image $\bar{\mu}_{\mathbb{R}}(M)$ given by a hyperplane arrangement:

$$F_{k} = \{ y \in \mathbb{R}^{d} : \langle y, u_{k} \rangle + \lambda_{k} \geqslant 0 \},$$

$$G_{k} = \{ y \in \mathbb{R}^{d} : \langle y, u_{k} \rangle + \lambda_{k} \leqslant 0 \},$$

$$H_{k} = \{ y \in \mathbb{R}^{d} : \langle y, u_{k} \rangle + \lambda_{k} = 0 \} = F_{k} \cap G_{k}.$$

Example

$T^*\mathbb{CP}^2$

- From before, $S^1 \subset \mathbb{C}^3 \leadsto \mathbb{CP}^2 = \mu^{-1}(\lambda)/S^1$ with residual T^2 -action and moment polytope $\bar{\mu}(\mathbb{CP}^2) = \Delta_2$.
- Same arrangement as toric case but now $\bar{\mu}_{\mathbb{R}}$ is surjective, for hypertoric $\mathcal{T}^*\mathbb{CP}^2$.

Real Image

Extended Core

Residual S¹-Action

- $T^*\mathbb{C}^n$ has an S^1 -action from rotating cotangent fibres:
 - $\tau \cdot (z, w) = (z, \tau w).$
- ▶ Descends to $\bar{\mu}_{\mathbb{C}}^{-1}(0)$ as $\bar{\mu}_{\mathbb{C}}$ is S^1 -equivariant, so $\mathcal{M}^{S^1} \subseteq \bar{\mu}_{\mathbb{C}}(\mathcal{M})$.

Extended Core of M

- $\mathcal{E} := \bar{\mu}_{\mathbb{C}}^{-1}(0) = \{ [z, w] \in M : z_k w_k = 0, \forall k \}.$
- ▶ Breaks up further: for $A \subseteq \{1, ..., n\}$,

$$\mathcal{E}_A := \{ [z, w] \in M : w_k = 0 \text{ for } k \in A, \ z_k = 0 \text{ for } k \notin A \}.$$

• $\bar{\mu}_{\mathbb{R}}(\mathcal{E}_A) =: \Delta_A$, polyhedra from arrangement.

Example

$$ar{\mu}_{\mathbb{R}}(\mathit{T}^*\mathbb{CP}^2)$$

Combinatorics of the S^1 -Action

▶ S^1 does not acts as a subtorus of T^d globally, but does restricted to each \mathcal{E}_A :

$$\tau \cdot [z, w] = [z, \tau w] = [\tau_1^{-1} z_1, \dots, \tau_n^{-1} z_n; \tau_1 w_1, \dots, \tau_n w_n],$$
where $\tau_i = \begin{cases} \tau, & \text{if } i \in A, \\ 1, & \text{otherwise.} \end{cases}$

- Restricted to \mathcal{E}_A , circle S^1 acts a subtorus of *original* torus T^n .
- Moment map

$$\Phi|_{A}[z, w] = -\left\langle \mu_{\mathbb{R}}(z, w), \sum_{i \in A} u_{i} \right\rangle.$$

Product S^1 -Action

Set-Up

- Global moment map for this S^1 -action is $\Phi[z, w] = ||w||^2$.
- ▶ Product $M \times \mathbb{C}$ with S^1 -action:

$$e^{i\theta} \cdot (\mathbf{m}, \xi) = (e^{i\theta} \cdot \mathbf{m}, e^{i\theta} \xi) \leadsto \rho(\mathbf{m}, \xi) = \Phi[\mathbf{z}, \mathbf{w}] + |\xi|^2.$$

▶ Preimage at level ϵ for $(m, \xi) \in M \times \mathbb{C}$ is:

$$\rho^{-1}(\epsilon) = \left\{ (m, \xi) : \Phi(m) \leqslant \epsilon, |\xi| = e^{i\theta} \sqrt{\epsilon - \Phi(m)} \right\}$$
$$= \left\{ (m, \xi) : \Phi(m) < \epsilon, |\xi| = e^{i\theta} \sqrt{\epsilon - \Phi(m)} \right\}$$
$$\sqcup \left\{ (m, 0) : \Phi(m) = \epsilon \right\} =: \Sigma_1 \sqcup \Sigma_2.$$

Symplectic Cut

Definition

Quotient $M_{\epsilon-\mathrm{cut}} := \rho^{-1}(\epsilon)/S^1 \cong (\Sigma_1 \sqcup \Sigma_2)/S^1$ is called the **symplectic cut** of M at level- ϵ [Ler95].

What does it look like?

$$\Sigma_1 = \{ (\mathbf{m}, \xi) : \Phi(\mathbf{m}) < \epsilon, |\xi| = e^{i\theta} \sqrt{\epsilon - \Phi(\mathbf{m})} \},$$

$$\Sigma_2 = \{ (\mathbf{m}, 0) : \Phi(\mathbf{m}) = \epsilon \}.$$

- $\Sigma_1 \cong \{ m \in M : \Phi(m) < \epsilon \} \times S^1$, so $\Sigma_1/S^1 \cong \{ \Phi(m) < \epsilon \}$;
- $\Sigma_2 \cong \Phi^{-1}(\epsilon)/S^1$.
- ▶ $\Phi : M \to \mathbb{R}$ is proper, so the symplectic cut $M_{\epsilon-\text{cut}}$ is compact.

Compact Hyperplane Arrangement

Moment Polyptychs

- ▶ Recall: S^1 -action on \mathcal{E}_A depends combinatorially on $A \subseteq \{1, \dots, n\}$.
- $M_{\epsilon-\text{cut}}$ is obtained by "throwing-away" the part of M with $\Phi(m) > \epsilon$ on each \mathcal{E}_A .
- Amounts to intersection each Δ_A with half-space [Pro04], with normal $-\sum_{i\in A} u_i$, from

$$\Phi|_{\mathcal{E}_A}[z,w] = -\bigg\langle \mu_{\mathbb{R}}(z,w), \sum_{i\in A} u_i \bigg\rangle.$$

We call such an arrangement of polytopes a moment polyptych.

5. Compactification & Symplectic Cutting

Examples

Example for $T^*\mathbb{CP}^2$

5. Compactification & Symplectic Cutting

Examples

Example for $T^*\mathbb{CP}^3$

Motivation

Verlinde Formula

- Let \mathcal{N} be the moduli space of stable SL_2 -bundles over Σ_2 ; it is isomorphic to \mathbb{CP}^3 [NR69].
- Geometric quantisation $Q(\mathcal{N}) := H^0(\mathcal{N}; \mathcal{L}^{\otimes k})$; its dimension equals the **Verlinde formula** [Ver88]; [JW92],

$$\dim \mathcal{Q}(\mathcal{N}) = \operatorname{Ver}(k) = \frac{k^3}{6} + k^2 + \frac{11k}{6} + 1$$
$$= \frac{(k+1)(k+2)(k+3)}{3!}.$$

Named after Dutch physicist Erik Verlinde, who was working on conformal field theories.

Integration

Riemann-Roch-Hirzebruch Theorem

For toric X, lattice point count of Δ_X equals to Euler characteristic,

$$\chi(X) = \int_{X} e^{c_1(\mathcal{O}(k))} \cdot \operatorname{Td}(TX).$$

Example

For $X = \mathbb{CP}^3$, have $e^{c_1(\mathcal{O}(k))} = 1 + kH + \frac{k^2}{2}H^2 + \frac{k^3}{6}H^3$, and $\mathrm{Td}(T\mathbb{CP}^3) = 1 + 2H + \frac{11}{6}H^2 + H^3$:

$$\chi(\mathbb{CP}^3) = \int_{\mathbb{CP}^3} \left(\frac{k^3}{6} + k^2 + \frac{11k}{6} + 1 \right) \cdot H^3 + \dots = \text{Ver}(k).$$

Our Direction

Lattice Points

- So $\operatorname{Ver}(k) = \chi(\mathbb{CP}^3) = \#(k \cdot \Delta_3 \cap \mathbb{Z}^3)$.
- Anything similar for hypertoric manifolds?

Equivariant Verlinde Formula

- ▶ Recently, equivariant Verlinde formula for moduli spaces Higgs bundle, M, popped up [GP17].
- dim $\mathcal{Q}(\mathcal{M}) = \infty$, but \mathcal{M} has a \mathbb{C}^* -action.
- ▶ Decompose into C*-weight spaces:

$$\dim \mathcal{Q}(\mathcal{M}) = \sum t^n \cdot \dim \mathcal{Q}_n(\mathcal{M}),$$

but now dim $Q_n(\mathcal{M}) < \infty$.

Localisation

Fixed-Point Formula

$$\sum_{q \in \Delta} e^{\langle q, \phi \rangle} = \sum_{p \in M^T} \frac{e^{\langle p, \phi \rangle}}{\prod_{k=1}^n (1 - e^{\langle \alpha_k^p, \phi \rangle})},$$

with edge vectors α_k^p , and $\langle \alpha_k^p, \phi \rangle \neq 0$, [Bar93].

▶ Letting $\phi \to 0$ gets the lattice point count (for Delzant Δ).

Example for $T^*\mathbb{CP}^3$

For $(T^*\mathbb{CP}^3)_{\epsilon-\text{cut}}$, get

$$\frac{(\epsilon+1)(\epsilon+2)(\epsilon+3)}{3!} \cdot \frac{(k+\epsilon+1)(k+\epsilon+2)(k+\epsilon+3)}{3!}$$

Observe that for $\epsilon = 0$, it becomes Ver(k).

6. Outlook 37/₃₉

Other Hypertoric Manifolds

Non-Convex Core

Want to see what happens for hypertoric manifolds with non-convex cores.
